

5	a con	foller for transferring the messages between the message network and such one
6	of the first dir	rectors.
1	3.	The system interface recited in claim 1 wherein each one of the second
2	directors incl	udes:
3	a data	a pipe coupled between an input of such one of the second directors and the
4	cache memor	y;
5	a cont	roller for transferring the messages between the message network and such one
6	of the second	directors.
1	4.	The system interface recited in claim 2 wherein each one of the second
2	directors includes:	
3	a data	a pipe coupled between an input of such one of the second directors and the
4	cache memor	y; /
5	a cont	roller for transferring the messages between the message network and such one
6	of the second	directors.
1	5.	The system interface recited in claim 1 wherein each one of the first directors
2	includes:	
3	a data	a pipe coupled between an input of such one of the first directors and the cache
4	memory;	
5	a mici	roprocessor, and
6	a cont	roller coupled to the microprocessor and the data pipe for controlling the
7	transfer of the	e messages between the message network and such one of the first directors and
8	for controllin	g the data between the input of such one of the first directors and the cache
9	memory.	
1	6.	The system interface recited in claim 1 wherein each one of the second
2	directors incl	udes:
3	a data	a pipe coupled between an input of such one of the second directors and the
4	cache memor	y; /

5	a microprocessor; and		
6	a controller coupled to the microprocessor and the data pipe for controlling the		
7	transfer of the messages between the message network and such one of the second directors		
8	and for controlling the data between the input of such one of the second directors and the		
9	cache memory.		
1	7. The system interface recited in claim 5 wherein each one of the second		
2	directors includes:		
3	a data pipe coupled between an input of such one of the second directors and the		
4	cache memory;		
5	a microprocessor; and		
6	a controller coupled to the microprocessor and the data pipe for controlling the		
7	transfer of the messages between the message network and such one of the second directors		
8	and for controlling the data between the input of such one of the second directors and the		
9	cache memory.		
1	8. A data storage system for transferring data between a host computer/server		
2	and a bank of disk drives through a system interface, such system interface comprising:		
3	(a) a plurality of first director boards coupled to host computer/server, each one		
4	of the first director boards having		
5	(i) a plurality of first directors; and		
6	(ii) a crossbar switch having input/output ports coupled to the first		
7	directors on such one of the first director boards and a pair of output/input ports;		
8	(b) a plurality of second director boards coupled to the bank of disk drives, each		
9	one of the second director boards having:		
10	(i) a plurality of second directors; and		
11	(ii) a crossbar switch having input/output ports coupled to the second		
12	directors on such one of the second director boards and a pair of output/input ports;		
13	(c) a data transfer section having a cache memory, such cache memory being		
14	coupled to the plurality of first and second directors;		

directors includes;

cache memory;

2

3

15	(d)	a message network, operative independently of the data transfer section, such	
16	message netv	vork comprising:	
17	a pair of message network boards, each one of such message network boards having:		
18	a switching n	etwork having a plurality input/outpyt ports, each one of such pair of	
19	input/output 1	ports being coupled to a corresponding one of the pair of output/input ports of	
20	the crossbar switches of the plurality of first director boards and the plurality of second		
21	director boards; and		
22	(e)	wherein the first and second directors control data transfer between the host	
23	computer and	I the bank of disk drives in response to messages passing between the first	
24	directors and	the second directors through the message network to facilitate the data transfer	
25	between host	computer/server and the bank of disk drives with such data passing through the	
26	cache memor	y in the data transfer section.	
1	9.	The system interface recited in claim 8 wherein each one of the first directors	
2	includes:		
3	a data	a pipe coupled between an input of such one of the first directors and the cache	
4	memory;		
5	a conf	troller for transferring the messages between the message network and such one	
6	of the first di	rectors.	
1	10.	The system interface recited in claim 8 wherein each one of the second	
2	directors incl	udes:	
3	a data	a pipe coupled between an input of such one of the second directors and the	
4	cache memor	y; /	
5	a conf	troller for transferring the messages between the message network and such one	
6	of the second	directors.	
1	11.	The system interface recited in claim 9 wherein each one of the second	

a data pipe coupled between an input of such one of the second directors and the

5	a controller for transferring the messages between the message network and such one		
6	of the second directors.		
1	12. The system interface recited in claim & wherein each one of the first directors		
2	includes:		
3	a data pipe coupled between an input of such one of the first directors and the cache		
4	memory;		
5	a microprocessor; and		
6	a controller coupled to the microprocessor and the data pipe for controlling the		
7	transfer of the messages between the message network and such one of the first directors and		
8	for controlling the data between the input of such one of the first directors and the cache		
9	memory.		
1	13. The system interface recited in claim 8 wherein each one of the second		
2	directors includes:		
3	a data pipe coupled between an input of such one of the second directors and the		
4	cache memory;		
5	a microprocessor; and		
6	a controller coupled to the microprocessor and the data pipe for controlling the transfer of the		
7	messages between the message/network and such one of the second directors and for		
8	controlling the data between the input of such one of the second directors and the cache		
9	memory.		
1	14. The system interface recited in claim 12 wherein each one of the second		
2	directors includes:		
3	a data pipe coupled between an input of such one of the second directors and the		
4	cache memory;		
5	a microprocessor; and		
6	a controller coupled to the microprocessor and the data pipe for controlling the		
7	transfer of the messages between the message network and such one of the second directors		

9 cache memory.
